The Career Assessment Inventory (CAI) takes individual’s workplace interests and compares them with other individuals currently in one of the 111 careers in their database. The instrument helps college-bound and non-college bond people find a job geared towards their interests.

There are currently two versions of the CAI – The Enhanced Version and the Vocational Version. The Vocational version targets careers in which less than two years of post-secondary training are necessary.

The Enhanced Version includes a 370-item report using a 5-point scale for responses. Testing takes 35 to 40 minutes to complete and is done online or pencil-to-paper format.

Reliability and Validity

The Career Assessment Inventory is well known and well established instrument, used as a norm for many in searching for careers. Test-retest correlation ranged from 0.91 to 0.96 for the general theme scales; 0.88 to 0.95 for the basic interest scale; 0.81 to 0.96 for the occupational scales (Zarrella & Schuerger, 1990). An internal consistency coefficient between 0.89 and 0.92 supports high content
validity. The CAI is strongly like with the Strong-Campbell Interest Inventory, the Kuder Occupational Interest Survey, and Jackson Vocational Interest Survey. There is only one study available concerning the application of the CAI.
