The Kessler Psychological Distress Scale (K6) is an abbreviated version of the K10, widely used measure for either screening or severity. Due to the K6’s brevity and consistency across sub-samples, it is preferred when screening for mood or anxiety disorders. Four questions are not used in the K6: the ‘tired out for no good reason’ question and three of the ‘if not none of the time’ questions were eliminated.

Self-Administered Kessler Psychological Distress Scale (K6)

Reliability and Validity

After the K6 was used in two of the largest ongoing national health tracking surveys in the U.S. (the CDC Behavioral Risk Factors Surveillance Survey and the SAMHSA National Household Survey), other countries began studying the validity of the K6. All of these studies concluded that the K6 is found to be consistent when used in multiple surveys, the K6 performed just as well at the K10. The K6 has also been proved to have little bias in regards to education and sex.

Administration, Analysis and Reporting

Statistics Solutions consists of a team of professional methodologists and statisticians that can assist the student or professional researcher in administering the survey instrument, collecting the data, conducting the analyses and explaining the results.
