The Fear of Negative Evaluation (FNE) instrument measures discomfort and distress in interpersonal interactions. Specifically, this instrument is used to measure apprehension in subjects when negatively evaluated.

The Fear of Negative Evaluation (FNE) test includes 30 items with a true-false response format. The test takes approximately 10 minutes to complete and is mainly given to adults. There exists a brief version of the Fear of Negative Evaluation consisting of 12 items with a 5-point Likert response.

Authors

Validity and Reliability

The Cronbach alpha rating for the internal reliability is reported at .94 to .98. The test-retest reliability was .78 to .94 according to Watson & Friend. The FNE scale showed high validity to its strong correlation rating with several scales such as: Talyor’s Manifest Anxiety Scale, Jackson’s Personality Research Form, anxiety measures, and personality measures.
